About

This project is parallel research to the [GFC canopy assessment](#) by [Owen Smith](#) for [Dr. Cho's GISC 4903 - Special Topics in GIS](#) . It's focus is on creating an open source canopy classification system designed specifically to utilize [NAIP imagery](#) within an efficient python module built on [Scikit-learn](#), [GDAL](#), and [NumPy](#).

The hope is to create an alternative to proprietary classification systems (i.e. Textron) to be used for ongoing research into canopy change and the need for efficient data creation that is required.

Source Code

The source code for the project can be viewed in the [Canopy FOSS GitHub repository](#)
